

Technology Stack

Auto-Ticket Classification using Flow Designer

Architecture & Technology Components

1. Technical Architecture

The solution is implemented entirely within the ServiceNow platform. The student uses the School IT Tickets interface, ticket records are stored in a custom table, Flow Designer applies classification rules, and ServiceNow email, ACLs, roles and Update Sets support notification, security and change tracking.

Architecture Flow

Student Interface >> School IT Ticket Table >> Flow Designer (Classification) >> Email Notification

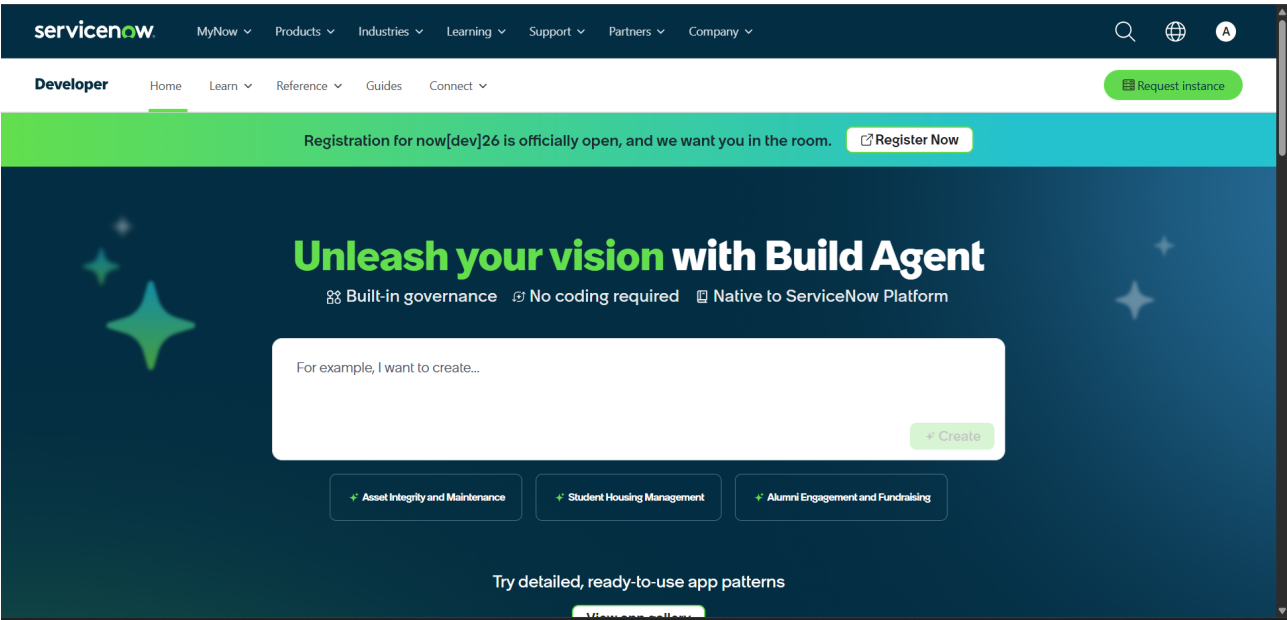

Figure 1: Technical architecture - ServiceNow platform overview.

2. Components & Technologies

#	Component	Description	Technology
1	User Interface	Interface to create and view tickets	ServiceNow Next Experience
2	Application Logic	Keyword-based classification workflow	ServiceNow Flow Designer
3	Database	Stores ticket records and fields	ServiceNow platform database
4	Security	Controls access to table and records	ServiceNow ACLs and Roles
5	Change Tracking	Tracks customizations	ServiceNow Update Sets

6	Infrastructure	Platform services and execution	ServiceNow Cloud Platform
---	----------------	---------------------------------	---------------------------

Note: No external APIs, cloud databases, file storage, or ML models are used in this implementation.

3. Application Characteristics

#	Characteristic	Description
1	Open-Source Frameworks	No separate framework used - built on ServiceNow platform.
2	Security	Custom table uses ACL and role configuration.
3	Scalability	Event-driven flow applies same classification to multiple records.
4	Availability	Accessed through ServiceNow School IT Tickets module.
5	Performance	Classification occurs automatically after record creation.

4. Implementation Evidence
