

IDEATION PHASE

Define the Problem Statements

Date	01 October 2026
Team ID	SWTID-2026-9397
Project Name	Auto-Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Customer Problem Statement

The project considers two primary users: the student who raises the IT request and the helpdesk technician who processes it. The statements below describe their goal, barrier, reason for the barrier, and resulting feeling.

User	Problem Statement
Student (Requester)	Goal: Submit an IT request quickly without needing technical knowledge. Barrier: The standard form requires selecting technical categories that may not be understood. Reason: Ticket categorization requires IT knowledge that typical students do not have. Feeling: Frustration and uncertainty about whether the request was submitted correctly.
IT Helpdesk Technician	Goal: Review incoming requests that are already categorized correctly. Barrier: Technicians must spend time manually reviewing descriptions and classifying tickets. Reason: Requester tickets arrive without categories or with incorrect choices. Feeling: Time wasted on basic administration rather than resolving the reported technical problems.

Problem Statement & Resolution Impact Flow

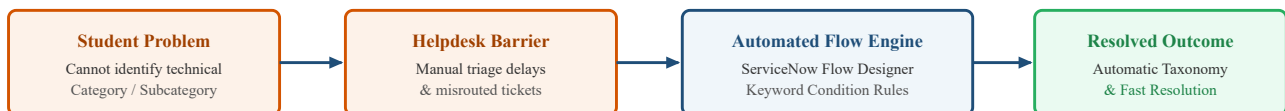

Figure 1: Problem statement to resolution impact workflow.

Problem Context and Solution Objective

In school environments, students regularly encounter routine technical issues such as Wi-Fi drops in libraries, projector connection problems in smart classrooms, forgotten portal passwords, or unresponsive computers. Forcing requesters to understand internal IT taxonomy causes misclassification and triage backlog. The objective of this project is to implement an automated rule-driven classification flow using ServiceNow Flow Designer that consumes natural-language descriptions, assigns the correct Category and Subcategory, and dispatches an immediate email confirmation to the requester.
