

IDEATION PHASE

Empathize and Discover (Empathy Map)

Date	01 October 2026
Team ID	SWTID-2026-9397
Project Name	Auto-Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Scenario

A student encounters an IT issue in the school environment (such as Wi-Fi not connecting or a classroom projector failing), opens the IT helpdesk service, and submits a request for technical support.

THINKS	FEELS
"I just want my Wi-Fi to work so I can finish my coursework." "Which category should I choose? I do not know the difference between network subcategories." "If I pick the wrong option, will someone still fix it?"	- Anxious about potential delays in classroom activities. - Confused when presented with technical categories. - Relieved when an immediate acknowledgment email is received.
SAYS	DOES
"The projector in Hall B won't turn on." "I can't log in to my student portal account." "The library computer is running very slowly."	- Opens the School IT Tickets form on the platform. - Enters name and describes the problem in plain language. - Submits the ticket and checks email for confirmation.
PAINS	GAINS
- Frustration caused by technical jargon. - Time wasted attempting to categorize an issue. - Uncertainty about whether the ticket reached the right team.	- Simplified submission requiring only Caller and Short Description. - Fast, automatic classification without manual selection. - Clear email acknowledgment with assigned ticket number.

Empathy-Driven User Discovery Flow
