

Problem-Solution Fit

Auto-Ticket Classification using Flow Designer

Validating the solution against the problem

1. Problem Summary

Students submitting IT tickets must manually select technical categories, leading to misclassification and delayed triage. Technicians spend excessive time re-categorizing tickets before resolution begins.

2. Proposed Solution

A ServiceNow Flow Designer workflow that automatically classifies tickets based on keyword detection in the student's short description, eliminating manual category selection.

3. Fit Analysis

Problem	Solution	Fit
Students confused by category dropdowns	Short description-only submission form	Students only need to describe their issue naturally.
Tickets misclassified due to wrong selection	Keyword-based auto-classification	Supported keywords consistently map to correct categories.
Delayed triage by technicians	Instant classification on record creation	Technicians receive pre-sorted tickets immediately.
No submission confirmation	Automatic email acknowledgment	Students receive immediate confirmation email.
No change tracking for customizations	Update Set captures all changes	All configurations tracked and exportable as XML.
