

Proposed Solution

Auto-Ticket Classification using Flow Designer

Detailed solution design

1. Solution Overview

The proposed solution uses ServiceNow Flow Designer to create an event-driven workflow that triggers on School IT Ticket record creation. The flow evaluates the Short Description field against predefined keyword rules and automatically populates Category and Subcategory fields.

2. Solution Components

Component	Purpose	Implementation
School IT Ticket Table	Custom data model for ticket records	Custom table with fields: Number, Caller, Short Description, Category, Subcategory, State, Assignment Group
Dependent Choices	Category-Subcategory relationship	Subcategory choices depend on selected Category value
Flow Designer Flow	Automatic classification engine	Trigger: Record Created on School IT Ticket; Conditions check keywords; Actions set Category/Subcategory
Email Notification	Requester acknowledgment	Email action sends confirmation to Caller after ticket creation
ACLs & Roles	Security controls	Access control lists restrict table and record access by role
Update Set	Change tracking & deployment	Project Update Set captures all customizations for export

3. Classification Rules

Keyword(s) Detected	Category	Subcategory
Wi-Fi, Network, Connectivity	Network	Wi-Fi / Connectivity
Projector, Hardware, Display	Hardware	Projector / Display
Password, Login, Access	Access	Password / Login
Slow, Performance, Lag	Performance	System Performance

4. Workflow Sequence

1. Student opens School IT Ticket form and enters Caller + Short Description.
2. Student submits the form - Record is created in the School IT Ticket table.
3. Flow Designer trigger fires on Record Created event.
4. Flow evaluates Short Description against keyword conditions.

5. Matching condition sets Category and Subcategory on the ticket.
6. Email notification is sent to the Caller email address.
7. Technician views the pre-classified ticket in the School IT Tickets list.
