

Solution Architecture

Auto-Ticket Classification using Flow Designer

System architecture and integration design

1. Architecture Overview

The entire solution operates within the ServiceNow cloud platform. There are no external services, APIs, or databases. The architecture consists of four layers: Presentation, Logic, Data, and Platform Services.

2. Architecture Layers

Layer	Components	Technology
Presentation	School IT Ticket form, School IT Tickets list view	ServiceNow Next Experience UI
Logic	Auto Classify Flow, keyword conditions, email action	ServiceNow Flow Designer
Data	School IT Ticket table, fields, choices, dependent values	ServiceNow platform database
Platform Services	ACLs, Roles, Update Sets, Email service	ServiceNow platform

3. Integration Points

All integration is internal to ServiceNow:

- Record Created trigger - connects table events to Flow Designer.
- Flow Designer - reads/writes School IT Ticket record fields.
- Email Action - uses ServiceNow email service to notify Caller.
- Update Set - captures table, field, choice, and flow changes for deployment.

4. Security Architecture

Control	Scope	Implementation
ACLs	Table-level and record-level access	Configured on School IT Ticket table
Roles	User permissions	Assigned to control who can create/view/edit tickets
Update Set	Change governance	All customizations tracked in Project Update Set
