

Customer Journey Map

Auto-Ticket Classification using Flow Designer

Mapping the end-to-end ticket experience

1. Journey Stages

Stage	Actor	Action	Touchpoint	Pain Point	Opportunity
Enter	Student	Opens School IT Tickets form and enters Caller + Short Description.	School IT Ticket form	Unsure which category to select.	Remove manual category selection.
Trigger	System	Record creation triggers Auto Classify flow.	Flow Designer trigger	None (automated).	Ensure trigger fires reliably.
Classify	Flow Designer	Checks keywords and sets Category/Subcategory.	Flow conditions/actions	Vague descriptions may miss rules.	Expand keyword coverage.
Notify	System	Sends acknowledgment email to Caller.	Email notification	Student unsure if request was received.	Immediate confirmation.
Process	Technician	Views pre-classified ticket and begins resolution.	School IT Tickets list	Manual re-triage was needed before.	Pre-sorted tickets save time.

2. Journey Flow

Student submits ticket >> Record Created trigger fires >> Flow Designer evaluates keywords >> Category & Subcategory auto-assigned >> Email notification sent to student >> Technician views classified ticket >> Resolution begins.

Note: The journey eliminates the manual triage step, reducing time-to-action for the technician.
