Project Name	Auto-Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution

The project team proposes a ServiceNow-based solution to simplify school IT helpdesk ticket submission and reduce the manual effort required to classify incoming requests.

The proposed solution consists of:

- A custom **School IT Ticket** (u_school_it_ticket) table designed for school IT requests.
- A simplified ticket submission form where requesters enter only the **Caller** and **Short Description**.
- An automated workflow built with **Flow Designer** that inspects the short description for predefined keywords and automatically assigns the **Category** and **Subcategory**.
- Dependent Category and Subcategory choice lists ensuring taxonomy integrity.
- An automated **Email Notification** sent to the caller acknowledging ticket receipt.
- Project tracking through ServiceNow **Update Sets** for controlled change management and export.

Implementation Evidence

Figure 1: School IT Ticket form used for submitting the request.

Flow Designer Decision Logic Flowchart

Figure 2: Flow Designer keyword-driven execution logic flowchart.

Flowchart Architecture & Execution Explanation

Workflow Execution Flowchart Breakdown:

- Trigger Condition:** The flow initiates whenever a record is created in the `u_school_it_ticket` table where the `Category` field is empty. This prevents overwriting tickets where a technician has already manually chosen a category.
- Keyword Decision Branch 1 (Network / Wi-Fi):** If the `Short Description` contains the terms "wifi" or "network", the flow executes an *Update Record* action setting `Category` = Network and `Subcategory` = Wi-Fi.
- Keyword Decision Branch 2 (Hardware / Projector):** Else if the `Short Description` contains "projector" or "hardware", the record is updated with `Category` = Hardware and `Subcategory` = Projector.
- Keyword Decision Branch 3 (Access / Password):** Else if the `Short Description` contains "password" or "login", the flow populates `Category` = Access and `Subcategory` = Forgot Password.
- Keyword Decision Branch 4 (Performance / Slow Computer):** Else if the `Short Description` contains "slow" or "hang", the system assigns `Category` = Performance and `Subcategory` = Slow Computer.
- Notification Step:** Following categorization, the flow triggers the *Send Email* action using the platform notification engine, sending an acknowledgment message to the `Caller` with the generated ticket reference number.

Implementation Evidence - Automatic Classification

The screenshot shows a ServiceNow ticket form for a 'School IT Ticket'. The 'Short description' field contains 'Wi-Fi not working in library'. The 'Category' is set to 'Network' and the 'Subcategory' is set to 'Wi-Fi'. The 'Status' is 'New'. The 'Assigned to' field is empty. The 'Updated' field shows '2023-09-20 10:00:00'. The 'Created' field shows '2023-09-20 10:00:00'. The 'Updated by' field shows 'System Administrator'. The 'Created by' field shows 'System Administrator'. The 'Updated by' field shows 'System Administrator'. The 'Created by' field shows 'System Administrator'.

Figure 3: School IT Ticket showing the automatic classification result.

The screenshot shows an email acknowledgment preview. The subject is 'Preview Email'. The body text reads: 'Hello, your IT support ticket has been received and automatically categorized. Our support team will review it shortly.' Below the text is a reference ID: 'Ref:MSG0000242_cUwO6n3sRXxEiaoCHSYx'. The email is displayed in a window with a 'Close' button in the top right corner.

Figure 4: Email acknowledgment preview generated after the request was received.

Summary of Results

The implementation successfully demonstrates the automated workflow: when a student submits a ticket describing a network failure ("Wi-Fi not working in library"), Flow Designer evaluates the condition, sets Category to Network and Subcategory to Wi-Fi, and sends an automated acknowledgment email to the caller. Technicians see correctly classified tickets ready for immediate action.
