

IDEATION PHASE

Brainstorm & Idea Prioritization

ServiceNow School IT Helpdesk Automation

Date:28 September 2026

Team ID:NM-2026-IT-042

Project Name:Auto-Ticket Classification using Flow Designer

Maximum Marks:4 Marks

STEP 1: TEAM GATHERING, COLLABORATION AND PROBLEM STATEMENT SELECTION

The project team met to evaluate the operational challenges faced by the School IT Helpdesk. During the session, the team identified the primary pain points experienced by two core stakeholder groups: students and IT technicians. Students frequently struggle with complex technical taxonomy when submitting tickets, while technicians spend valuable troubleshooting time manually triaging and re-categorizing incoming requests.

Selected Problem Statement: The school IT helpdesk requires a streamlined ticket submission process with automated classification, enabling students to report IT issues using everyday language without needing knowledge of internal technical categories, while ensuring instant routing and acknowledgment.

STEP 2: BRAINSTORM, IDEA LISTING AND GROUPING

The team brainstormed potential technological and procedural solutions, grouping them into four core architectural pillars:

1. Ticket Classification	2. User Experience	3. Notification & Workflow	4. ServiceNow Architecture
- Keyword-based rule engine - Dependent category choices - ML-based NLP classifier - Manual technician triage	- Minimal 2-field form (Caller, Issue) - Portal-based self-service - Contextual help tooltips - Mobile-friendly submission	- Instant email acknowledgment - Helpdesk technician notifications - Automated status updates - Group assignment routing	- Custom table (u_school_it_ticket) - Low-code Flow Designer - Role-based ACL security - XML Update Set tracking

STEP 3: IDEA PRIORITIZATION TABLE

Brainstormed concepts were assessed based on strategic **Importance** to solving user pain points and technical **Feasibility** within the ServiceNow platform environment:

Brainstormed Idea / Feature	Importance	Feasibility
Automatic keyword-based classification (Flow Designer)	High	High
Simple ticket submission form (Caller + Short Description)	High	High
Dependent Category and Subcategory architecture	High	High
Automated requester email acknowledgment	Medium	High
Custom School IT Ticket table (u_school_it_ticket)	High	High
Update Set deployment tracking and XML export	High	High
ACL security controls for data protection	High	High
AI/ML-based classification model (Predictive Intelligence)	Medium	Medium
Automated technician assignment rules	Medium	Medium

IDEA PRIORITIZATION MATRIX (FEASIBILITY VS. IMPORTANCE)

The visual matrix below illustrates the strategic placement of brainstormed ideas. Items in the top-right quadrant (High Importance & High Feasibility) represent the core scope selected for implementation.

SELECTED SOLUTION ARCHITECTURE SUMMARY

Selected Solution: Auto-Ticket Classification using ServiceNow Flow Designer. The team selected a low-code, high-reliability architecture that directly fulfills all functional requirements without external API dependencies or complex licensing overhead.

- **Data Layer:** A purpose-built custom table (u_school_it_ticket) with fields for Number, Caller, Short Description, Description, Category, Subcategory, State, and Assignment.
- **Logic & Automation Layer:** An event-driven ServiceNow Flow Designer workflow triggered on *Record Created* when Category is empty. Condition branches evaluate key terms (e.g., "wifi", "network", "projector", "password", "login", "slow") and assign the proper Category and dependent Subcategory.
- **Communication Layer:** An automated outbound email action generates an acknowledgment notification to the Caller with the ticket number and assigned classification details.
- **Deployment:** All schema elements, business logic, choice lists, and notification templates are captured in the project Update Set and exported as XML for version-controlled deployment.
