

IDEATION PHASE

Define the Problem Statements

ServiceNow School IT Helpdesk Automation

Date:28 September 2026

Team ID:NM-2026-IT-042

Project Name:Auto-Ticket Classification using Flow Designer

Maximum Marks:2 Marks

CUSTOMER PROBLEM STATEMENT FRAMEWORK

The School IT Support ecosystem relies on effective collaboration between two key personas: the **Student** (the primary customer raising support requests) and the **IT Helpdesk Technician** (the service agent responsible for diagnosing and resolving issues). The 5-element canvas below articulates their specific goals, barriers, root causes, and emotional impacts.

ID	I am... (Persona)	I am trying to... (Goal)	But... (Barrier)	Because... (Root Cause)	Which makes me feel...
PS-1	A student in the school environment experiencing an IT failure.	Submit an IT support ticket quickly and have it resolved promptly.	I do not understand the technical category and subcategory dropdown options.	Helpdesk forms require specialized IT taxonomy that non-technical users do not know.	Confused and Frustrated
PS-2	An IT helpdesk technician managing the incoming ticket queue.	Process, triage, and resolve technical issues within SLA targets.	I spend excessive time reviewing unclassified or wrongly classified tickets.	Students choose arbitrary categories or leave them blank, forcing manual triage.	Overwhelmed and Delayed

FORMULATED PROBLEM STATEMENTS

PS-1: Student Persona (Primary Requester)

"I am a student using the school IT helpdesk. I am trying to submit an IT support request quickly and correctly, but I do not know which technical category or subcategory to select because different IT issues require specialized technical classification, which makes me feel confused, uncertain, and frustrated when trying to access digital learning resources."

PS-2: Helpdesk Technician Persona (Service Agent)

"I am an IT helpdesk technician. I am trying to process and resolve incoming support requests efficiently, but I have to spend substantial time manually reviewing, reading, and re-classifying tickets because students frequently choose incorrect categories or skip them entirely, which leads to triage bottlenecks and delays actual hands-on troubleshooting."

STRATEGIC ALIGNMENT WITH PROPOSED FLOW DESIGNER AUTOMATION

Identified Challenge	ServiceNow Technical Solution	Measurable Project Outcome
Taxonomy confusion during submission	Simplify form to Caller & natural language Short Description.	Zero category confusion; submission completed in under 30 seconds.
Manual triage workload for technicians	Automated Flow Designer keyword condition branches.	Instant Category and Subcategory population upon record creation.
Requester uncertainty after submission	Automated email acknowledgment with classification details.	Immediate feedback loop confirming receipt and assigned category.
