

IDEATION PHASE Empathize & Discover - Empathy Map ServiceNow School IT Helpdesk Automation	Date:28 September 2026 Team ID:NM-2026-IT-042 Project Name:Auto-Ticket Classification using Flow Designer Maximum Marks:4 Marks
---	---

EMPATHY MAP CANVAS: STUDENT PERSONA (PRIMARY REQUESTER)

The empathy map captures the sensory, cognitive, and emotional experience of a student trying to report an IT disruption in a classroom, library, or computer lab.

THINK & FEEL "I just want my Wi-Fi or computer fixed so I can finish my assignment." "I don't know what 'Network Infrastructure' vs 'Endpoint Telecom' means." "I worry my ticket will get lost or delayed if I click the wrong category." "I want immediate confirmation that someone received my request."	HEAR - Teachers saying: "Submit a helpdesk ticket through the school portal." - Friends saying: "It takes forever if you don't pick the right department." - IT staff asking: "What category did you put down for this issue?" - Announcements regarding network outages and lab schedules.
SEE - Complex ticketing forms with intimidating technical dropdown lists. - Multiple choices: Hardware, Software, Network, Telephony, Security. - The physical issue: projector blinking red, browser saying "No Internet". - Classmates struggling with similar connectivity or password glitches.	SAY & DO - Says: "My Wi-Fi is disconnected" or "The lab projector is not displaying." - Enters: Student name, lab location, and brief problem description. - Leaves category blank or randomly selects the first choice. - Frequently checks inbox hoping for a status update.
PAINS - Fear of selecting the incorrect classification and delaying support. - Frustration with complex forms and technical jargon. - Lost study time due to unresolved hardware or network issues.	GAINS - Ultra-simple ticket submission requiring only basic details. - Automatic backend categorization without technical guesswork. - Instant email confirmation with assigned ticket reference number.

EMPATHY MAP CANVAS: IT HELPDESK TECHNICIAN (SERVICE AGENT)

The technician canvas focuses on the manual triage effort, queue management challenges, and the operational value of consistent categorization.

THINK & FEEL "I spend more time triaging and sorting tickets than actually solving technical problems." "If tickets were categorized accurately from the start, resolution times would plummet." "I want clean queue metrics and consistent Category/Subcategory relationships."	HEAR - Complaints from instructors: "Our classroom projector has been down all morning." - Students asking: "Did you get my ticket about the lab Wi-Fi?" - Management requesting: "Reduce ticket first-response time and triage delays."
SEE - A disorganized queue of unclassified or misclassified ticket records. - Vague descriptions like "Internet issue" mapped under "General Hardware". - Technicians manually opening each ticket to re-assign Category and Subcategory.	SAY & DO - Tells students: "Please be specific in your short description." - Manually updates ticket fields before routing to specialized technician. - Validates resolved issues and closes tickets in ServiceNow.
PAINS - High cognitive load and repetitive administrative triage. - Inaccurate reporting data caused by inconsistent manual categorization. - Extended time-to-first-touch for high-priority classroom disruptions.	GAINS - Instant, standardized categorization based on clear keyword logic. - Elimination of triage overhead, allowing immediate technical intervention. - Reliable historical reporting metrics and automated requester notifications.

Sprint-1 Deliverable: Ideation & Empathy Mapping	Evaluated By: Project Review Committee	Maximum Marks: 4 Marks
