PROPOSED SOLUTION SPECIFICATION

The project delivers an automated, low-code classification solution within the ServiceNow platform. By combining a dedicated custom schema with Flow Designer automation, the system eliminates manual helpdesk triage while maintaining strict data integrity.

| S.No | Evaluation Parameter              | Technical Description & Implementation Details                                                                                                                                                                                                                                                                                           |
|------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Problem Statement                 | Students face difficulty selecting accurate technical categories when submitting IT support requests. Consequently, IT helpdesk technicians must manually inspect and triage each incoming ticket, leading to delayed response and resolution times.                                                                                     |
| 2    | Idea / Solution Description       | Develop a custom School IT Ticket table (u_school_it_ticket) in ServiceNow with simplified submission fields (Caller, Short Description). Implement an automated Flow Designer workflow triggered on record creation to analyze issue keywords and populate Category and Subcategory automatically, followed by an acknowledgment email. |
| 3    | Novelty / Uniqueness              | Replaces complex multi-level dropdowns with intelligent backend keyword evaluation. Pairs keyword-based condition logic with dependent choice field architecture, giving students a zero-friction experience while delivering structured, standardized data to technicians.                                                              |
| 4    | Social Impact / User Satisfaction | Significantly improves student satisfaction by eliminating submission confusion and offering instant email confirmation. For technicians, it removes repetitive triage tasks, allowing them to focus immediately on problem diagnosis and repair.                                                                                        |
| 5    | Operational & Business Value      | Delivers high operational efficiency for educational institutions without requiring expensive machine-learning infrastructure or third-party APIs. Built natively on ServiceNow using standard platform capabilities, ensuring high reliability and zero extra licensing costs.                                                          |
| 6    | Scalability of the Solution       | The modular Flow Designer architecture is easily extensible. New keyword branches, categories, subcategories, assignment groups, and automated approval workflows can be added seamlessly as campus IT services expand.                                                                                                                  |

IMPLEMENTATION EVIDENCE - USER SUBMISSION FORM

The screenshot shows the ServiceNow user interface for creating a 'School IT Ticket'. The form is titled 'School IT Ticket - TK10001012'. It includes a search bar at the top right. The form fields are organized into two columns. The left column contains: 'Number' (with a value of 'TK10001012'), 'Short description' (with a value of 'Wi-Fi not working in library'), 'Description' (a text area), 'Category' (a dropdown menu set to 'Network'), 'Subcategory' (a dropdown menu set to 'Wi-Fi'), and 'State' (a dropdown menu set to 'None'). The right column contains: 'Caller' (a dropdown menu set to 'System Administrator'), 'Assigned Group' (a dropdown menu), and 'Assigned to' (a dropdown menu). At the bottom of the form, there are 'Update' and 'Delete' buttons.

Figure 1: School IT Ticket form configured with clean, accessible fields for simplified requester submission.

FLOW DESIGNER CLASSIFICATION LOGIC FLOWCHART

The flowchart below illustrates the automated execution path executed by Flow Designer each time a student submits a new ticket record.
