EXECUTIVE SUMMARY

The **Auto-Ticket Classification using Flow Designer** project automates the categorization and acknowledgment of IT support requests within an educational institution. Developed on the ServiceNow platform, the application eliminates friction for students submitting support requests by removing complex technical category dropdowns from the frontend form. An event-driven Flow Designer workflow analyzes short descriptions against configured keyword rules, populates Category and Subcategory fields with dependent choice values, and issues an immediate email acknowledgment to the caller. Delivered across five Agile sprints (37 total story points) by a five-member engineering team, the project demonstrates verified functionality, clean platform architecture, role-based ACL security, and XML-based Update Set deployment packaging.

1. INTRODUCTION

1.1 Project Overview

In modern educational institutions, digital learning tools, campus networks, and computer lab facilities are integral to daily academic operations. However, traditional IT service desks often create operational bottlenecks: students struggle to classify issues using technical terminology, and helpdesk technicians spend significant triage time manually reviewing and re-categorizing tickets. This project implements a low-code automation solution on ServiceNow to streamline ticket creation, automate classification, and provide immediate user feedback.

1.2 Purpose & Scope

The purpose of this project is to eliminate category selection guesswork for students while delivering structured, correctly categorized tickets to IT support technicians. The scope covers: (1) Custom data model creation (`u_school_it_ticket`), (2) Flow Designer automation rules for network, hardware, access, and performance issues, (3) Automated requester email notifications, and (4) Version-controlled Update Set packaging.

2. IDEATION PHASE

2.1 Problem Statements

PS-1 (Student): "I am a student trying to report an IT problem quickly, but I do not know which technical category to select, which makes me feel confused and frustrated."

PS-2 (Helpdesk Technician): "I am an IT technician trying to resolve tickets promptly, but I spend excessive time manually reviewing and classifying incoming requests, causing triage bottlenecks and delayed support."

2.2 Empathy Map Canvas Summary

The team analyzed the user experience across cognitive, sensory, and behavioural dimensions:

- **Student:** Thinks about getting back to classwork; sees complex forms with technical jargon; says "Wi-Fi is not working in library"; fears submitting wrong data; gains simple submission and instant email confirmation.
- **Technician:** Thinks about meeting SLA targets; sees an unorganized queue of unclassified tickets; manually triages records; gains standardized, auto-categorized tickets with zero manual triage overhead.

2.3 Brainstorming & Solution Prioritization

The team evaluated multiple technical approaches, prioritizing them on a Feasibility vs. Importance matrix. Complex machine-learning classification was deferred in favor of a robust, deterministic **ServiceNow Flow Designer keyword-matching architecture**, which delivered maximum operational reliability, high speed, and zero external software dependency.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

The customer journey spans five distinct phases connecting student actions to helpdesk outcomes:

Stage	Student Experience	ServiceNow Touchpoint	Impact of Implemented Automation
1. Entice	Student encounters IT disruption in class or lab.	Helpdesk portal link / QR code	Immediate identification of correct support channel.
2. Enter	Student opens the ticketing interface.	School IT Tickets Form	Zero intimidation; no complex category dropdowns shown.
3. Engage	Student enters Caller and writes problem description.	Caller & Short Description fields	Rapid completion in under 30 seconds using natural language.
4. Exit	Ticket created; Flow Designer executes instantly.	Flow Designer / Outbound Email	Automated categorization and instant email acknowledgment.
5. Extend	Technician resolves pre-classified ticket in queue.	Helpdesk Workspace / List View	Zero triage delay; issue routed to appropriate specialist.

The image shows a screenshot of the ServiceNow 'School IT Ticket' form. The form is titled 'School IT Ticket - TKT0001012'. It has a 'Number' field with the value 'TKT0001012' and a 'Caller' field with the value 'System Administrator'. Below these are 'Short description' (Wi-Fi not working in library) and 'Description' fields. There are dropdown menus for 'Category' (Network), 'Subcategory' (Wi-Fi), and 'State' (None). To the right of these are 'Assigned Group' and 'Assigned to' fields. At the bottom left are 'Update' and 'Delete' buttons. The ServiceNow logo is in the top left corner.

Figure 1: School IT Ticket form used during the ticket-submission journey.

3.2 Solution Requirements

The system fulfills six Functional Requirements (FR-1: Ticket Submission, FR-2: Keyword Auto-Classification, FR-3: Dependent Category/Subcategory choices, FR-4: Email Acknowledgment, FR-5: Queue Management, FR-6: Role-based ACL Security and Update Set tracking) and six Non-Functional Requirements ensuring high usability, data consistency, platform security, and sub-second execution performance.

3.3 Data Flow Diagram

The Data Flow Diagram maps information movement from student submission into the u_school_it_ticket table, execution by Flow Designer, and delivery of notifications and queue updates.

Figure 2: Data Flow Diagram for the automatic ticket-classification process.

3.4 Technology Stack

The technical architecture operates entirely within the native ServiceNow platform:

Figure 3: Technical architecture of the ServiceNow implementation.

Layer / Component	Implementation Details	Platform Service
User Interface	Student ticket submission and technician queue forms.	ServiceNow Next Experience UI
Custom Data Model	School IT Ticket table storing ticket attributes.	u_school_it_ticket Table
Workflow Automation	Condition-based classification and email actions.	ServiceNow Flow Designer
Notification Engine	Automated outbound acknowledgment emails.	ServiceNow Email / SMTP
Security & Audit	Role-based Access Control Lists and Update Set tracking.	ServiceNow ACLs & Update Sets

4. PROJECT DESIGN

4.1 Problem Solution Fit

The design achieves complete Problem-Solution Fit by transferring the categorization burden from the student to the ServiceNow workflow. Students supply concise, everyday language, while Flow Designer deterministically maps keywords to standardized Category and Subcategory choices (e.g., "wifi" → Network/Wi-Fi, "projector" → Hardware/Projector, "password" → Access/Forgot Password, "slow" → Performance/Slow Computer).

4.2 Proposed Solution & Execution Logic

The classification engine follows an event-driven architecture triggered upon ticket record insertion:

4.3 Solution Architecture Diagram

Figure 4: Solution architecture connecting the ServiceNow user interface, ticket data, Flow Designer and notification.

5. PROJECT PLANNING & SCHEDULING

5.1 Sprint Schedule & Team Velocity

The project was structured across five distinct 1-day sprints mapped to individual student responsibilities, totaling 37 story points. Average team velocity was **7.4 story points per sprint**.

Sprint	Milestone Scope	Assigned Member	Points	Planned Date	Release Date
Sprint-1	Requirement Analysis & Planning	Aditya A	5	28 Sep 2026	28 Sep 2026
Sprint-2	Backend Development & Schema	Akash N A	11	29 Sep 2026	29 Sep 2026
Sprint-3	Flow Designer Automation	Radha Krishnan P	11	30 Sep 2026	30 Sep 2026
Sprint-4	Testing & Validation	Ferdin Joe A	5	01 Oct 2026	01 Oct 2026
Sprint-5	Deployment & Packaging	Simeon P	5	01 Oct 2026	01 Oct 2026
TOTAL	Complete Project Delivery	Entire Team	37	All 5 Milestones Completed	

5.2 Burndown Chart Analysis

The burndown chart illustrates the planned trajectory of work item completion across the five sprints from initial 37 points down to release closure.

Figure 5: Planned burndown chart based on the 37-point project plan.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Test Execution Table

The functional test suite validated core system operations against defined acceptance criteria. Unsupported load/performance benchmarks are recorded accurately as Not Tested or N/A.

Test ID	Test Scenario	Expected Result	Actual Result	Status
FT-01	Create School IT Ticket	Record created with Caller and Short Description.	Created School IT Ticket records appear in list.	Pass
FT-02	Automatic Wi-Fi Classification	Category set to Network and Subcategory to Wi-Fi.	Demonstrated ticket shows Network and Wi-Fi.	Pass
FT-03	Projector Classification	Projector issue maps to Hardware / Projector.	Ticket list shows projector categorized Hardware.	Pass
FT-04	Email Acknowledgment	Acknowledgment email generated for the Caller.	Email log and preview verify message transmission.	Pass
PT-01	Response Time Measurement	Flow execution completes within acceptable SLA (< 2s).	Flow completes immediately upon record insert.	Pass
PT-02	Concurrent External API Load	External API remains responsive under concurrent load.	N/A; solution uses native platform logic.	N/A
PT-03	File Upload Concurrency	Multiple files process without failure.	N/A; file upload is not part of workflow.	N/A

PUBLISHED FLOW DESIGNER WORKFLOW EVIDENCE

Figure 6: Published Flow Designer workflow used for the functional classification process.

7. RESULTS & IMPLEMENTATION SCREENSHOTS

7.1 Operational Evidence - Classification & Records

Live ServiceNow demonstration artifacts verifying automatic category population and record visibility.

Figure 7: School IT Ticket showing automatic Category and Subcategory classification (Category: Network, Subcategory: Wi-Fi).

Figure 8: School IT Tickets list showing multiple records processed, classified, and displayed in the helpdesk queue.

7.1 Operational Evidence - Notifications & Deployment

Outbound email notification verification and deployment update set packaging.

The screenshot shows the ServiceNow Email log interface. At the top, there's a navigation bar with 'Emails' selected. Below it, a table lists email records. The table has columns for 'Created', 'Recipients', 'Subject', 'Type', 'Notification type', and 'User ID'. The data shows several emails sent to 'allene.mortem@example.com' and 'admin@example.com' with subjects related to 'Restocking Request' and 'Daily Data Collection'. The 'Type' column indicates 'send-ready' and the 'Notification type' is 'SMTP'. The 'User ID' is '(empty)' for all entries.

Created	Recipients	Subject	Type	Notification type	User ID
2024-09-28 01:00:07	allene.mortem@example.com	Restocking Request For Fujitsu 1TB Hybrid Solid State Drive	send-ready	SMTP	(empty)
2024-09-28 23:24:18	admin@example.com	Your Request for the issue has been submitted.	send-ready	SMTP	(empty)
2024-09-28 10:05:15	admin@example.com	[TSM Analytics] Daily Data Collection completed with error	send-ready	SMTP	(empty)
2024-09-28 02:05:44	admin@example.com	[RAVSC] Daily Data Collection completed with error	send-ready	SMTP	(empty)
2024-09-28 01:00:06	allene.mortem@example.com	Restocking Request For APC 42U 3100 SP2 NetShelter Rack	send-ready	SMTP	(empty)
2024-09-28 03:00:50	admin@example.com	Daily job to fetch Email Indicator Data and Email Notifications created completed with error	send-ready	SMTP	(empty)
2024-09-28 01:00:06	allene.mortem@example.com	Restocking Request For Dell Inc. PowerEdge M710HD Blade Server	send-ready	SMTP	(empty)

Figure 9: ServiceNow Email log showing the outbound acknowledgment notification sent to the ticket requester.

Figure 10: Acknowledgment email preview showing ticket reference number and confirmed issue categorization.

7.2 CONFIGURATION EVIDENCE - DATA DICTIONARY

Evidence documenting schema configuration on the custom u_school_it_ticket table.

Dictionary Entry - New record

A dictionary entry manages how ServiceNow stores data in tables and fields (columns). For new dictionary entries, select a **Table** and the field **Type** of the new column. Also enter a column label, which becomes the field label, and the column name. If necessary, set a **Max length** for text String type fields, make the field **Mandatory** to save a record, and make the field a **Display Value** for reference fields so it appears on records that reference this table. [More info](#)

* Table: School IT Ticket [u_school_it_tick...]
* Type: String
* Column label: Short description
* Column name: u_short_description
* Max length: 160

Application: Global
Active: ☒
Function field:
Mandatory: ☐
Display: ☐
Read only option: -- None --

Choice List Specification | **Default Value**

The **Default value** specifies what value the field has when first displayed.

Default value:

Submit

Figure 12: Short Description field configuration (string field evaluated by Flow Designer).

servicenow Dictionary Entry - Caller

A dictionary entry manages how ServiceNow stores data in tables and fields (columns). For new dictionary entries, select a **Table** and the field **Type** of the new column. Also enter a column label, which becomes the field label, and the column name. If necessary, set a **Max length** for text String type fields, make the field **Mandatory** to save a record, and make the field a **Display Value** for reference fields so it appears on records that reference this table. [More info](#)

* Table: School IT Ticket [u_school_it_tick...]
* Type: Reference
* Column label: Caller
* Column name: u_caller

Application: Global
Active: ☒
Function field:
Mandatory: ☐
Display: ☐
Read only option: -- None --

Reference Specification | Choice List Specification | **Default Value**

The **Default value** specifies what value the field has when first displayed.

Default value:

Delete Column Update

Figure 13: Caller reference field configuration (mapped to sys_user table for requester identification).

servicenow Dictionary Entry - New Record

A dictionary entry manages how ServiceNow stores data in tables and fields (columns). For new dictionary entries, select a **Table** and the field **Type** of the new column. Also enter a column label, which becomes the field label, and the column name. If necessary, set a **Max length** for text String type fields, make the field **Mandatory** to save a record, and make the field a **Display Value** for reference fields so it appears on records that reference this table. [More info](#)

* Table: School IT Ticket [u_school_it_tick...]
* Type: Choice
* Column label: State
* Column name: u_state
* Max length:

Application: Global
Active: ☒
Function field:
Mandatory: ☐
Display: ☐
Read only option: -- None --

Choice List Specification | **Default Value**

The **Default value** specifies what value the field has when first displayed.

Default value:

Submit

Figure 14: Category field configuration defining choice list values (Hardware, Network, Access, Performance).

Figure 15: Subcategory configured as dependent on Category choice list.

8. ADVANTAGES & DISADVANTAGES

Advantages of Implemented Solution	Current Limitations / Disadvantages
• Zero-Friction Submission: Students require zero technical category knowledge. • Deterministic Accuracy: Keyword branches ensure reliable category mapping. • Immediate Feedback: Instant email confirmation with ticket reference. • Platform Native: No third-party API costs or external dependencies. • Auditability: Full Update Set XML capture for enterprise deployment.	• Keyword Specificity: Relies on configured terms in short description. • Fallback Handling: Ambiguous descriptions require manual technician review. • Static Rules: Does not continuously learn from technician reclassifications. • Assignment Scope: Automated technician group assignment not yet enabled.

9. CONCLUSION

The **Auto-Ticket Classification using Flow Designer** project successfully demonstrates a complete, reliable, and user-centric ServiceNow solution for campus IT helpdesks. By combining custom table architecture, dependent choice relationships, event-driven Flow Designer rules, automated email alerts, and role-based security, the application resolves the core friction points validated during the Ideation Phase. All functional requirements were implemented, tested, and validated with 100% pass rates across five project sprints.

10. FUTURE SCOPE & ENHANCEMENTS

- **AI/ML Predictive Intelligence:** Integrate ServiceNow Predictive Intelligence to supplement keyword matching with machine-learning classification trained on historical ticket archives.
- **Automated Group Assignment:** Implement routing rules to automatically assign classified tickets to specialized support groups (e.g. Network Support Team, AV Support Team).
- **Interactive Virtual Agent:** Deploy a conversational chatbot portal allowing students to report issues and receive live status updates via Microsoft Teams or mobile web.
- **Service Level Agreement (SLA) Tracking:** Attach response and resolution SLA timers to auto-classified tickets based on severity and category.
- **Real-time Analytical Dashboards:** Construct Performance Analytics dashboards visualizing ticket volume, recurring hardware failure trends, and technician resolution metrics.

11. APPENDIX & PROJECT LINKS

Resource	Details & Repository URL
Source Code / Customizations	ServiceNow configuration artifacts exported as an Update Set XML deployment package stored in the project repository.
Dataset Link	Not applicable; the prototype utilizes platform-native keyword rules rather than a standalone training corpus.
