

IDEATION PHASE

Brainstorm & Idea Prioritization

Date	
Team ID	
Project Name	Auto-Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The team discussed the existing school IT helpdesk process and identified the main difficulties experienced by students and helpdesk technicians. Students may not know which technical category or subcategory matches their issue, while technicians spend additional time reviewing and classifying incoming requests.

Selected problem statement: The school IT helpdesk needs a simpler ticket submission process with automatic classification so that students can report IT issues without having to understand the internal technical categories.

Step 2: Brainstorm, Idea Listing and Grouping

The team generated several possible approaches and grouped them according to their purpose.

1. Ticket Classification Ideas

- Keyword-based classification
- Rule-based classification
- AI-based classification
- Manual category selection

2. User Experience Ideas

- Simple ticket submission form
- Guided ticket submission
- Automatic classification

3. Notification and Assignment Ideas

- Email acknowledgment
- Technician notification
- Automatic assignment

4. ServiceNow Implementation Ideas

- Custom School IT Ticket table
- Flow Designer automation
- Dependent Category and Subcategory choices
- Update Set tracking
- Access Control Lists (ACLs)

Step 3: Idea Prioritization

Idea	Importance	Feasibility
Automatic keyword-based classification	High	High
Simple ticket submission	High	High
Dependent Category/Subcategory	High	High
Email acknowledgment	Medium	High
Custom ticket table	High	High
Update Set tracking	High	High

Idea	Importance	Feasibility
ACL access control	High	High
AI-based classification	Medium	Medium
Automatic technician assignment	Medium	Medium

Selected solution: Auto-Ticket Classification using ServiceNow Flow Designer. The selected approach uses a custom School IT Ticket table, keyword-based conditions, automatic category and subcategory assignment, and an acknowledgment email.

Prioritization Matrix & Evaluation Analysis

The team prioritized brainstormed concepts across two dimensions: organizational **Importance** (impact on reducing ticket triage bottleneck and requester confusion) and technical **Feasibility** within the available ServiceNow academic developer environment.

- **High Importance & High Feasibility:** The custom u_school_it_ticket table, Flow Designer keyword condition branches, dependent category/subcategory relationships, and Update Set tracking form the essential core of the project. These features deliver direct end-to-end automation with deterministic accuracy and zero external licensing overhead.
- **Medium Importance & High Feasibility:** Requester email acknowledgment provides immediate positive feedback confirming that the ticket has been received and categorized.
- **Medium Importance & Medium Feasibility:** Machine-learning predictive intelligence models and automated round-robin technician assignment were analyzed but reserved for future project phases to maintain focused, highly verifiable deliverable execution.

Implementation Architecture Plan

The selected solution eliminates the cognitive barrier for students by removing mandatory category fields from the submission form. Requester input is restricted to natural-language Short Descriptions and Caller reference. Flow Designer evaluates incoming text against predefined keyword triggers (network, hardware, password, performance) and immediately updates Category, Subcategory, and State while triggering an automated outbound acknowledgment notification.
