Project Name	Auto-Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution

The project team proposes a ServiceNow-based solution to simplify school IT helpdesk ticket submission and reduce the manual effort required to classify incoming requests.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Students may find it difficult to choose the correct technical category and subcategory when reporting an IT issue. At the same time, helpdesk technicians spend additional time reviewing and classifying requests before processing them.
2.	Idea / Solution description	Create a custom School IT Ticket table in ServiceNow. The requester provides Caller and Short Description. Flow Designer then checks the short description for configured keywords and updates Category and Subcategory automatically. An acknowledgment email is sent to the caller after submission.
3.	Novelty / Uniqueness	The solution moves the classification responsibility from the student to the ServiceNow workflow. It combines keyword-based automation with a dependent Category/Subcategory design so that the request is kept simple for the student while the helpdesk receives structured information.
4.	Social Impact / Customer Satisfaction	The solution can reduce confusion during ticket submission and provide immediate acknowledgment to the requester. For the helpdesk, automatic classification can reduce repetitive triage work and provide more consistently categorized requests.
5.	Business Model (Revenue Model)	This academic prototype is intended for internal school IT support and does not define a separate revenue model. Its value is operational: reducing manual effort, improving the consistency of ticket handling, and simplifying the requester experience.
6.	Scalability of the Solution	The flow structure can be extended with additional keywords, categories, subcategories, assignment rules, and notification steps. The same approach can also be adapted to other departments or support services within a ServiceNow environment.

Implementation Evidence

The screenshot shows the ServiceNow 'School IT Ticket' form. The 'Number' field is populated with 'TKT0000012'. The 'Caller' field is 'System Administrator'. The 'Short description' field contains 'WiFi not working in library'. The 'Description' field is empty. Below these are dropdown menus for 'Category' (set to 'Network'), 'Subcategory' (set to 'Wi-Fi'), and 'State' (set to 'None'). There are 'Update' and 'Delete' buttons at the bottom left of the form.

Flowchart Architecture & Execution Explanation

Workflow Execution Flowchart Breakdown:

- 1. Trigger Condition:** The flow initiates whenever a record is created in the `u_school_it_ticket` table where the `Category` field is empty. This prevents overwriting tickets where a technician has already manually chosen a category.
- 2. Keyword Decision Branch 1 (Network / Wi-Fi):** If the `Short Description` contains the terms "wifi" or "network", the flow executes an *Update Record* action setting `Category = Network` and `Subcategory = Wi-Fi`.
- 3. Keyword Decision Branch 2 (Hardware / Projector):** Else if the `Short Description` contains "projector" or "hardware", the record is updated with `Category = Hardware` and `Subcategory = Projector`.
- 4. Keyword Decision Branch 3 (Access / Password):** Else if the `Short Description` contains "password" or "login", the flow populates `Category = Access` and `Subcategory = Forgot Password`.
- 5. Keyword Decision Branch 4 (Performance / Slow Computer):** Else if the `Short Description` contains "slow" or "hang", the system assigns `Category = Performance` and `Subcategory = Slow Computer`.
- 6. Notification Step:** Following categorization, the flow triggers the *Send Email* action using the platform notification engine, sending an acknowledgment message to the `Caller` with the generated ticket reference number.

Implementation Evidence - Automatic Classification

The screenshot shows a 'School IT Ticket' form in the ServiceNow interface. The ticket number is 'TKT00000002'. The description is 'Wi-Fi not working in library'. The category is 'Network' and the subcategory is 'Wi-Fi'. The assigned group is 'System Administrator'. The form includes fields for 'Number', 'Color', 'Description', 'Category', 'Subcategory', 'Status', 'Assigned Group', and 'Assigned To'. There are 'Update' and 'Delete' buttons at the bottom left.

Figure 3: School IT Ticket showing the automatic classification result.

The screenshot shows a 'Preview Email' window. The email body contains the text: 'Hello, your IT support ticket has been received and automatically categorized. Our support team will review it shortly.' and 'Ref:MSG0000242_cUwO6n3sRXxEiaoCHSYx'. There are 'Update' and 'Delete' buttons at the top right, and a 'Close' button at the bottom right.

Figure 4: Email acknowledgment preview generated after the request was received.

Summary of Results

The implementation successfully demonstrates the automated workflow: when a student submits a ticket describing a network failure ("Wi-Fi not working in library"), Flow Designer evaluates the condition, sets Category to Network and Subcategory to Wi-Fi, and sends an automated acknowledgment email to the caller. Technicians see correctly classified tickets ready for immediate action.
